

Chronos App Summary

Repository-backed summary (1 page)

What it is

Chronos is an AI-powered historical timeline explorer. It generates citation-backed timelines, narratives, map events, and follow-up historical Q&A for a selected region and time range.

Who it is for

Primary persona: history-curious learners and researchers exploring a region or topic across time. Explicit persona definition in product docs: Not found in repo.

What it does

- Generates timelines in Quick and Deep modes.
- Shows geolocated events on a map with timeline playback controls.
- Provides map, timeline, event list, and narrative views for the same dataset.
- Offers search suggestions and map-click region discovery.
- Supports follow-up chat with a historian assistant per timeline.
- Persists local archives and supports share/export actions.

How it works (repo evidence)

- React + Vite frontend in App.tsx orchestrates views, state, and interaction flow.
- Frontend sends action-based POST requests to /api/generate via services/apiService.ts.
- api/generate.ts validates input, applies per-action and global rate limits, and dispatches actions: suggestions, regions, timeRange, timeline, followUp.
- Timeline generation merges Groq LLM output with Wikipedia lookups and Wikidata enrichment (api/generate.ts, lib/wikidata.ts).
- Timeline and chat history are persisted in browser localStorage (services/storageService.ts, components/ChatPanel.tsx).

How to run (minimal)

- 1. npm install
- 2. Copy .env.example to .env.local and set GROQ_API_KEY.
- 3. Run frontend: npm run dev (Vite dev server on port 3000).
- 4. Backend local run command needed for proxy target http://localhost:3001: Not found in repo.
